

Phoenix Technologies

- 1 NEC's RAID system constantly observes HDD's response, and if delay is observed, HDD will be separated from RAID.
- 2 The HDD is put under special supervision while a background diagnosis is done. Host access is processed without accessing the HDD under supervision.
- 3 In case the diagnosis result is temporary performance degradation, the HDD in question is returned to the ordinary use. If there are sector errors, the data is recovered on backup sectors, and the HDD is put back in RAID.
